

Well Type = 1 cell

A scatter plot showing the relationship between Time (H) on the x-axis and Relative Fluorescence on the y-axis for the $C_p = 15:21$ condition. The x-axis ranges from 0 to 15 hours, and the y-axis ranges from 2000 to 10000. The data points show a sharp increase in fluorescence starting around 11 hours, reaching over 10,000 units by 15 hours.
